

# Chaos and Uncertainty in Disability Experience

Rick Leavitt

Maine Event

September 27, 2002

**Chaos** is a name for any order that  
produces confusion in our minds

*George Santayana*

**Chaos** was the law of nature; Order was the  
dream of man

*Henry Brooks Adams*

# It is an Uncertain World

- ✍ Five-Year Treasury Yields
- ✍ Daily Temperature in Portland
- ✍ S&P 500 Index
- ✍ Bob Lee's Gambling Experience
- ✍ Disability Incidence

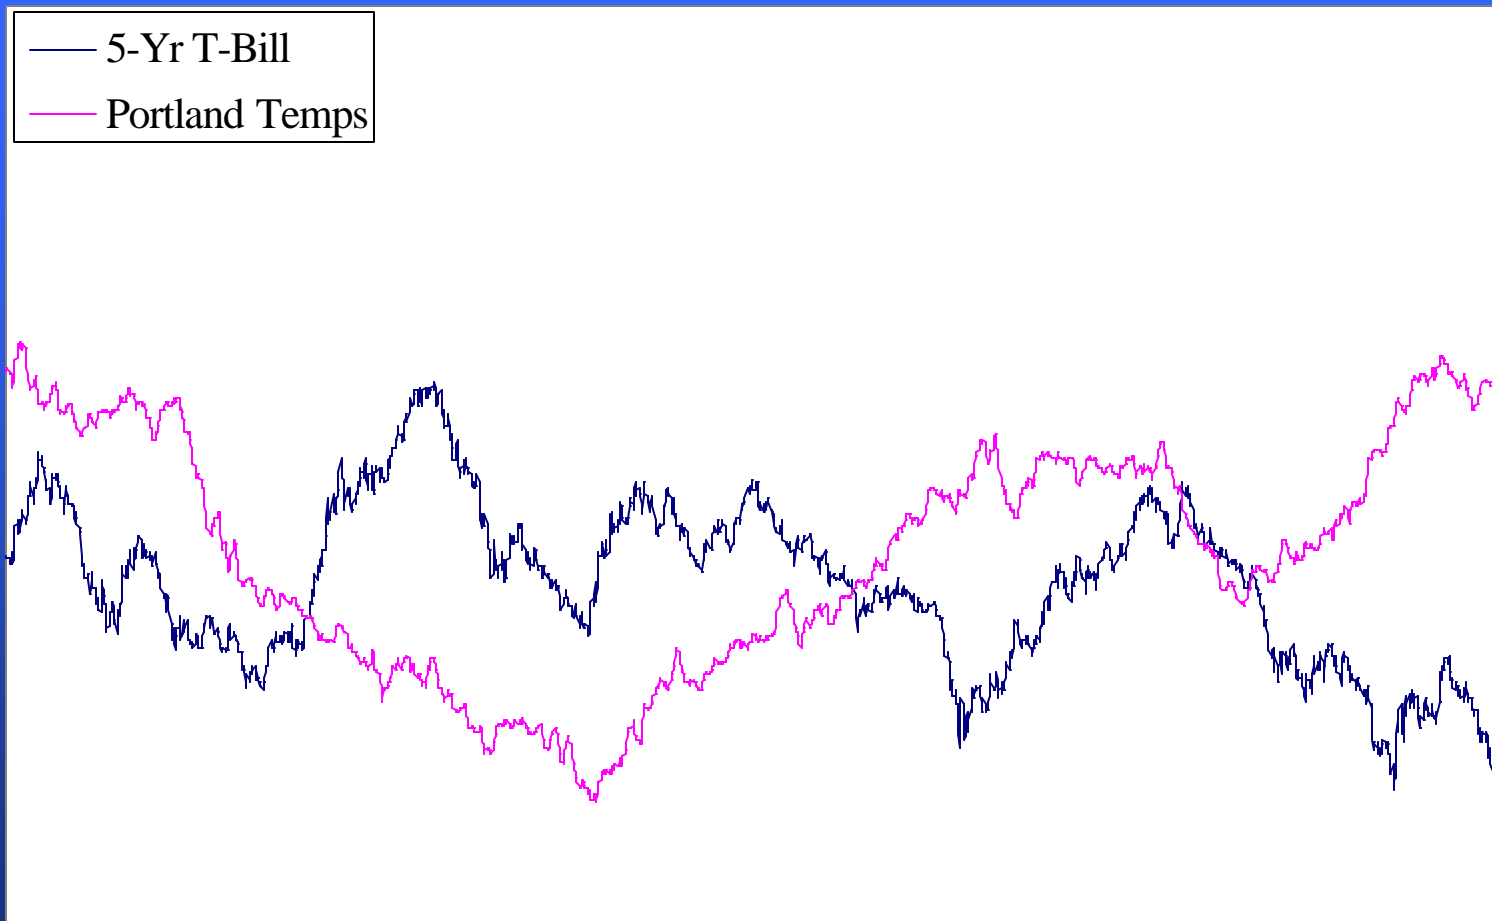

Given for one instant an intelligence which could comprehend all the forces by which nature is animated and the respective positions of the beings which compose it, if moreover this intelligence were vast enough to submit these data to analysis, it would embrace in the same formula both the movements of the largest bodies in the universe and those of the lightest atom; to it nothing would be uncertain, and the future as the past would be present to its eyes.

*Pierre Simon De Laplace, 1812*

The initial conditions predetermine the future

# Predictability

On April 8<sup>th</sup> in the year 2024, Burlington Vermont will experience a total eclipse of the sun. This eclipse will begin at 5:26 pm and last for 3 minutes and 35.9 seconds

# Predictability

# Simple Population Dynamics

## *Population Model*

N = Population

Max = Maximum Sustainable Population

P = Unknown Parameter

$$N_{t+1} = P * N_t * (Max - N_t)$$

$$X_{t+1} = A * X_t * (1 - X_t)$$

Where  $X = N / Max$

# Simple Population Dynamics

$$X_{new} = A * X_{old} * (1 - X_{old})$$

Example:

$$A = 2.5 \quad X_0 = 0.2$$

$$X_1 = 2.5 * 0.2 * (1 - 0.2) = 0.4$$

$$X_2 = 2.5 * 0.4 * (1 - 0.4) = 0.6$$

$$X_3 = 2.5 * 0.6 * (1 - 0.6) = 0.6$$

Population at 60% of maximum is at equilibrium

# Simple Population Dynamics

Equilibrium State

$$X = A * X * (1 - X)$$

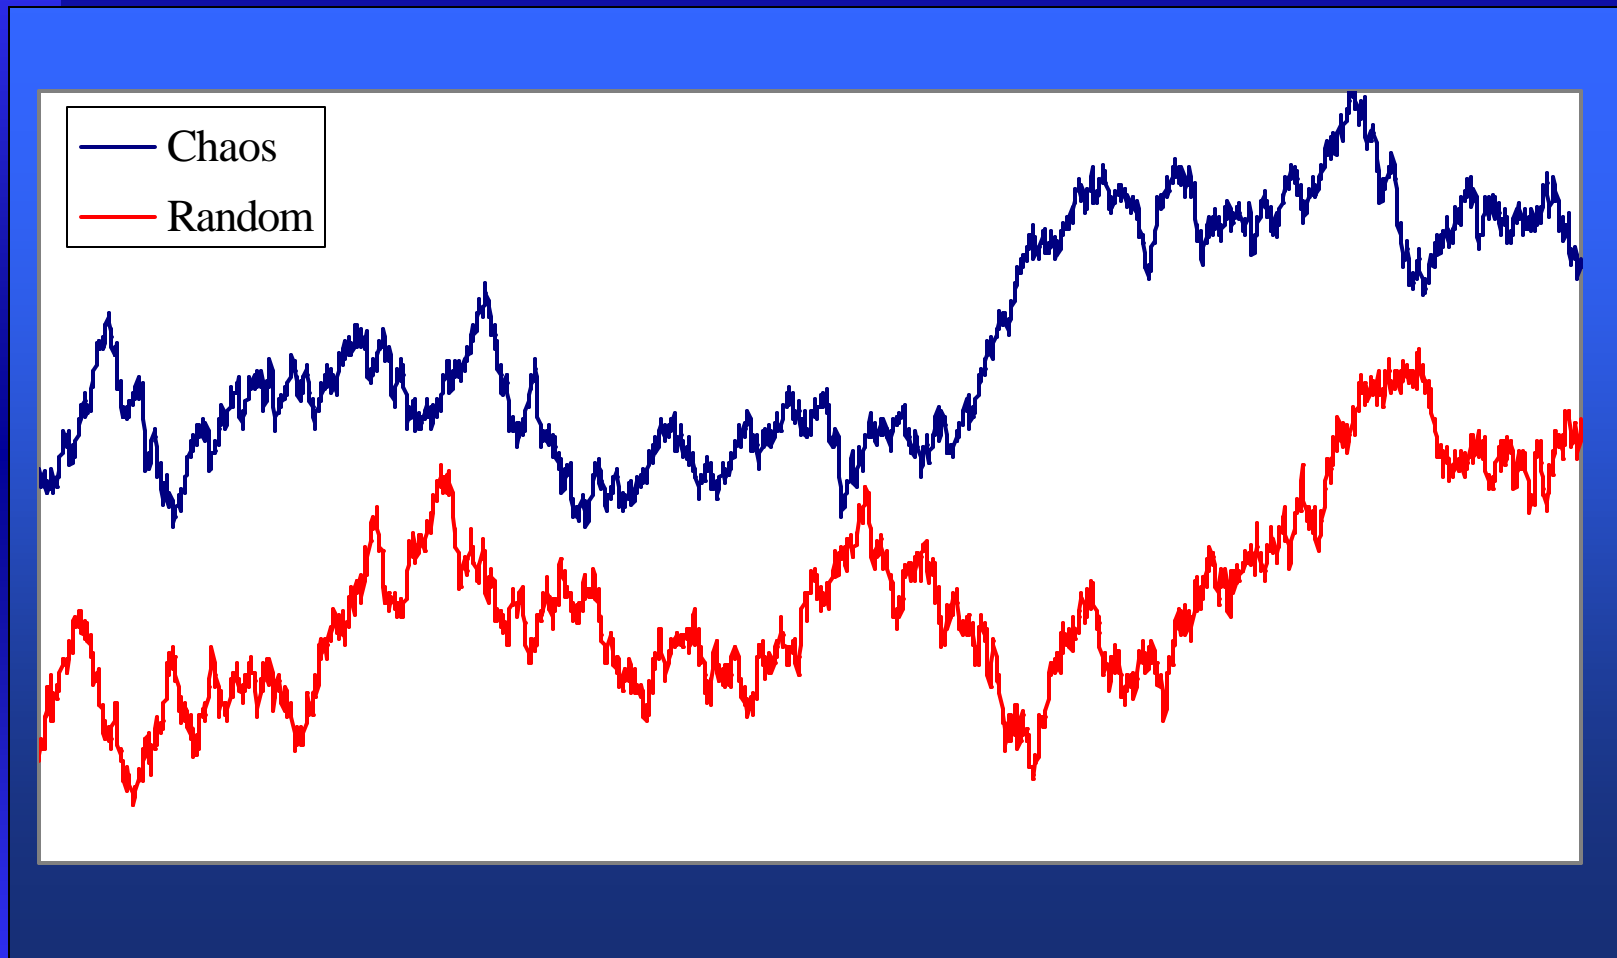

Equilibrium Solution

$$X = (A - 1) / A$$

Looks like a pretty simple problem

# Simple Population Dynamics

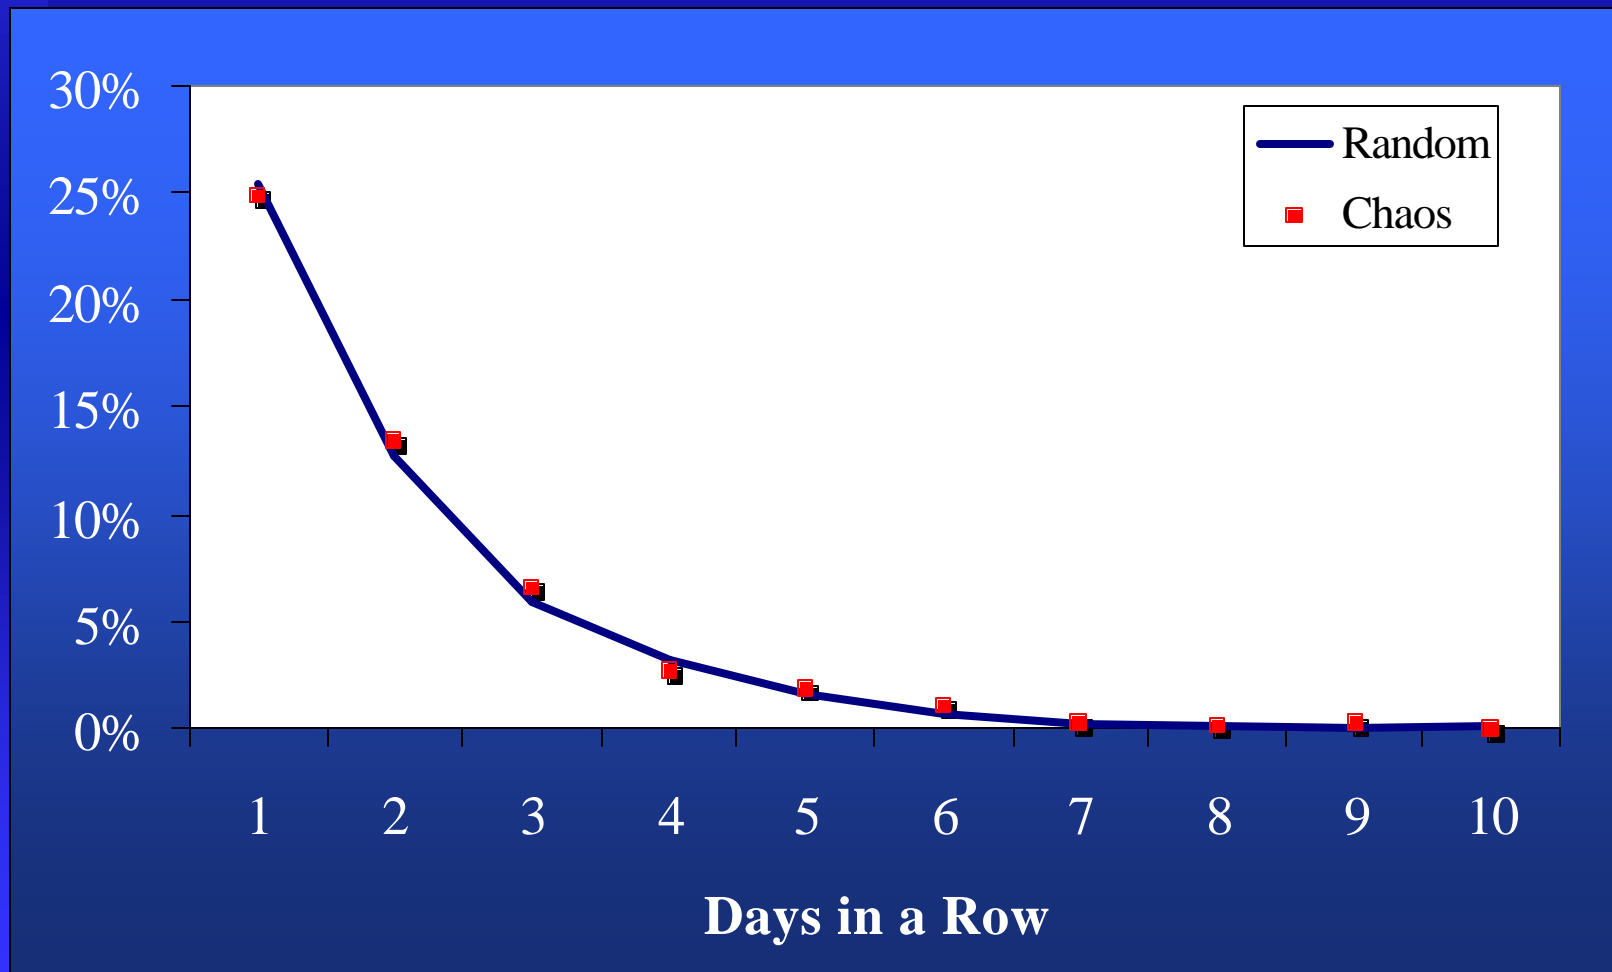

# Random versus Chaotic

Chaotic = Simple Population Dynamics

# Chaos

*Sensitive Dependence on Initial Conditions*

*implies*  
*Lack of Predictability*

# Signatures of Chaos

Chaotic Dynamics can result from a simple model, but must involve mechanism for feedback

Dynamics are fully determined, but highly unpredictable due to sensitive dependence on initial conditions

Time lag plots will reveal complicated structure

# Signatures of Randomness

One observation does not affect the next

Dynamics influenced by many factors

Time lag plots reveal no structure

Aggregate Behavior can be handled through statistics

# Signatures of Complex Systems

Dynamics are influenced by many variables, some of which may be chaotic

Dynamics resist analysis. Limited utility of computer simulations.

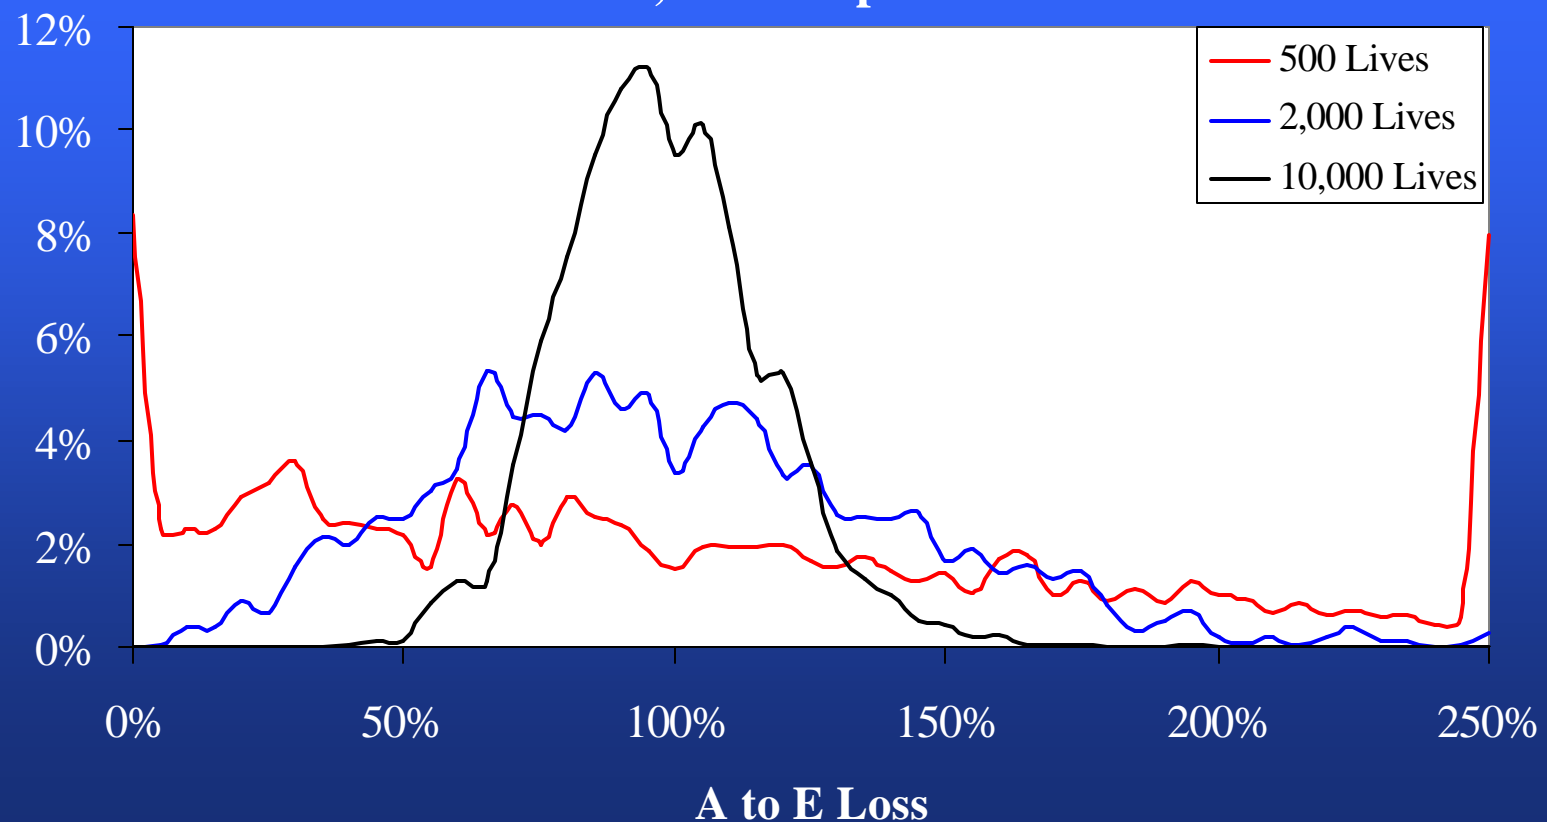

Sensitive Dependence on Initial Conditions  
- “the butterfly effect”

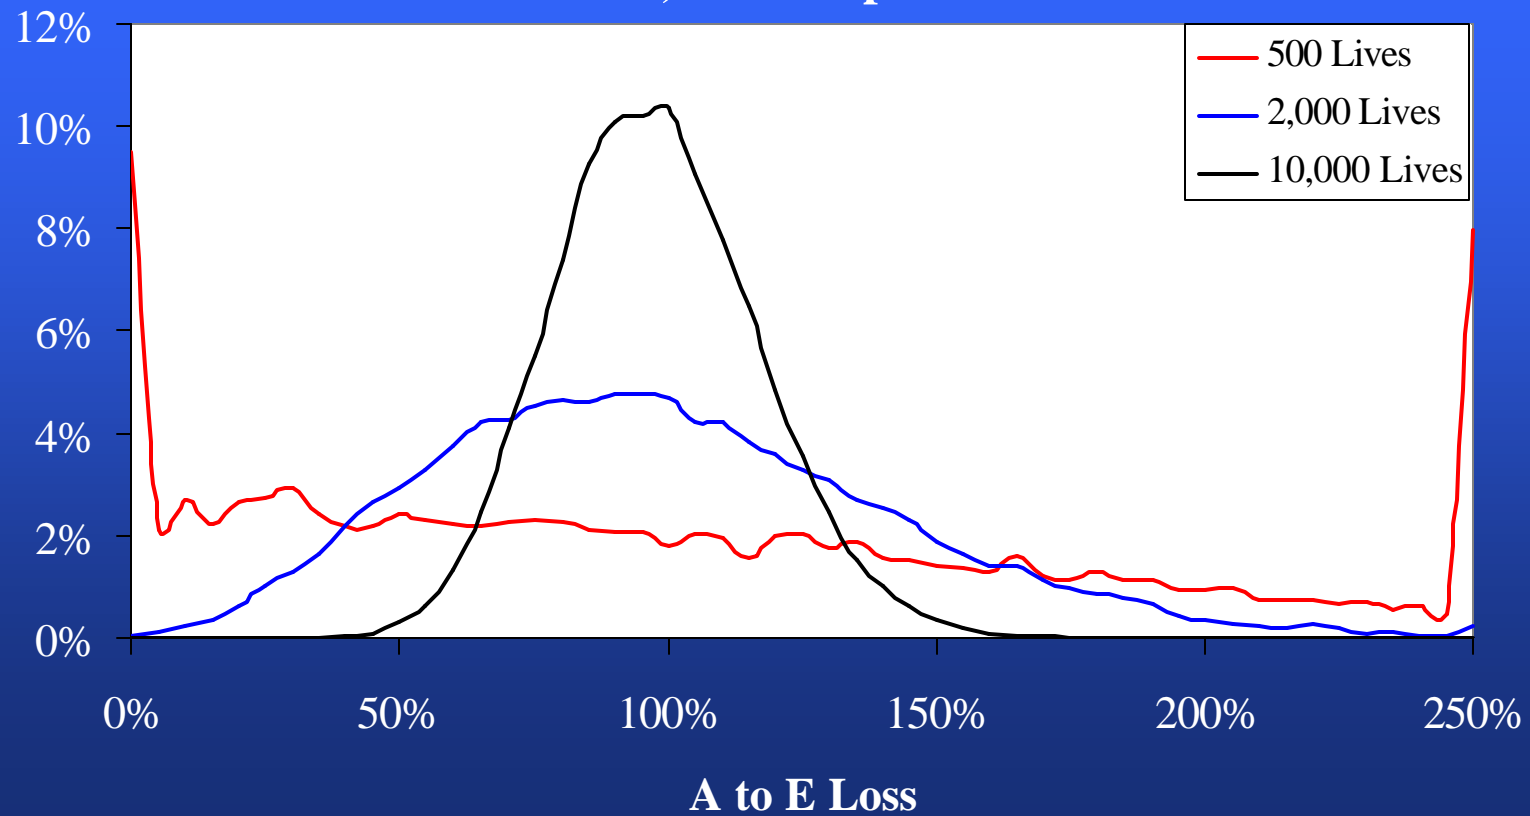

# Monte-Carlo Simulations of Disability Experience

# Monte-Carlo Simulations

A to E Loss by Quarter - 2 Million Lives

# Chaos in Disability Experience?

Disability Experience is unpredictable

Difficult to statistically measure Chaos

Lack of Predictability limits utility

Little impact of feedback mechanism

Disability experience is driven by many external factors, some of which may be chaotic
